

2025 Water Quality Report*

Aqua Illinois - Philo, PWSID# IL0190600

*Este informe contiene información muy importante sobre su agua de beber.
Tradúzcalo o hable con alguien que lo entienda bien.*

About Your Drinking Water

Aqua Illinois, Inc. (Aqua) is pleased to provide you with its 2025 Consumer Confidence Report for Philo (public water supply ID-IL0190600), which contains important information about your drinking water. The report summarizes the quality of water Aqua provided in 2025 - including details about water sources, what the water at your tap contains, and how it compares to standards set by regulatory agencies. We are pleased to report we were in compliance with all water quality regulations in 2025. Although the report lists only those regulated substances that were detected in your water, we test for more than what is reported. This report is a summary of our activities during 2025 and earlier. If you have any questions about the information in this report, please call Jennifer Mack at 224.602.6779 or visit our website at [AquaWater.com](https://www.aquawater.com).

Sources of Supply

Water for Philo is purchased from Illinois American-Champaign which comes from a groundwater aquifer. The Source Water Assessment for this system has been completed by the Illinois Environmental Protection Agency (IEPA). Information provided by this assessment indicates our water supply to be susceptible to contamination. This determination is based on a number of criteria including: monitoring conducted at the well; monitoring conducted at the distribution entry point; and available hydrogeologic well data. A copy of this report can be obtained by calling Jennifer Mack at 224.602.6779 or on the website <https://dataservices.epa.illinois.gov/swap/factsheet.aspx>.

Source of Drinking Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and groundwater wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria, which can come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants (IOCs)**, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides**, which can come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- **Organic chemical contaminants**, including *synthetic organic chemicals (SOCs)* and *volatile organic chemicals (VOCs)*, are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff and septic systems.

- **Radioactive contaminants**, which can be naturally occurring or be the result of oil and gas production and mining activities.

Drinking water, including bottled water, can reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline at (800.426.4791).

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immune compromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Centers for Disease Control guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline at (800.426.4791).

The following table lists contaminants that were detected during 2025 in your water system. The table provides the highest level found and range of the observed levels of regulated contaminants.

Water Source: Purchased water from Illinois American – Champaign; from an underground aquifer

Municipality served: Philo

2025 Water Quality Data: Aqua Illinois – Philo - PWSID# IL0190600

Contaminants	Level Found	Range of Levels	Federal/ State Standard MCL	Ideal Goal MCLG	Violation?	Sample Date	Major Sources in Drinking Water
DISINFECTANTS & DISINFECTION BYPRODUCTS- For haloacetic acids and total trihalomethanes, compliance is based on the locational running annual average (LRAA) of quarterly results for each sampling location.							
Chlorine, ppm	RAA = 2	0.5 – 2.7	MRDL =4	MRDLG =4	No	2025	Water additive used to control microbes
Total Haloacetic Acids (HAA5), ppb	LRAA = 29	14.26 – 28	60	NA	No	2025	Byproduct of drinking water disinfection
Total Trihalo-methanes, ppb	LRAA = 74	40.9 – 80.7	80	NA	No	2025	

LEAD AND COPPER RESULTS							
Lead & Copper	90th Percentile Level	# of Sites Exceeding Action Level	Federal/State Standard Action Level	Ideal Goal MCLG	Sample Date	Range	Major Sources in Drinking Water
Copper, ppm	0.073	0	1.3	1.3	2025	.0063 - .150	Corrosion of household plumbing
Lead, ppb	1.8	0	15	0	2025	ND – 3.4	Corrosion of household plumbing

Lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Aqua is responsible for providing high quality drinking water and removing lead pipes, but cannot control the variety of materials used in plumbing components in your home. You share the responsibility for protecting yourself and your family from the lead in your home plumbing. You can take responsibility by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk. Before drinking tap water, flush your pipes for several minutes by running your tap, taking a shower, doing laundry or a load of dishes. You can also use a filter certified by an American National Standards Institute accredited certifier to reduce lead in drinking water.

If you are concerned about lead in your water and wish to have your water tested, contact Aqua at 877-987-2782. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at <http://www.epa.gov/safewater/lead> . A copy of your systems lead tap sampling data may be viewed at [Drinking Water Watch](#).

A service line inventory has been prepared for this system and shows the composition of your service line. The inventory may be viewed at www.aquawater.com/leadmap.

Triennial or Less Frequent Monitoring: The state requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data, though accurate, is more than one year old.

2025 Violation Summary Table: None - We are pleased to report we were in compliance with all water quality parameters in 2025.

Illinois EPA's Sampling of Per- and Polyfluoroalkyl Substances (PFAS):

In 2021, our PWS was sampled as part of the State of Illinois PFAS Statewide Investigation. None were detected in our finished drinking water. The results are shown in the table below. GEN-X data has been included below in anticipation of future federal regulations that include monitoring for this PFAS compound. For more information regarding PFAS advisories in Illinois, please visit <https://epa.illinois.gov/topics/water-quality/pfas/pfas-healthadvisory.html>. Aqua has also posted information regarding proposed federal regulations on our website at AquaWater.com/pfas.

PFAS (Forever Chemicals) Entry Point Sampling from 2021

Name	Chemical Name	Range of Detections (ppt)
GEN-X	Hexafluoropropylene oxide (dimer acid and ammonium salt)	ND
PFOA	Perfluorooctanoic acid	ND
PFOS	Perfluorooctane sulfonate	ND
PFBS	Perfluorobutane sulfonic acid and Perfluorobutane sulfonate	ND
PFHxA	Perfluorohexanoic acid	ND
PFHxS	Perfluorohexanesulfonic acid	ND
PFNA	Perfluorononanoic acid	ND

ND = Not Detected

2025 Water Quality Data: Illinois American- Champaign IL0195300 Water System Information

Contaminants	Level Found	Range of Levels	Federal/ State Standard MCL	Ideal Goal MCLG	Violation	Sample Date	Major Sources in Drinking Water
INORGANIC CONTAMINANTS							
Arsenic, ppb	2	0 – 2	10	0	No	2024	Erosion of natural deposits
Fluoride, ppm	0.66	0.61 – 0.66	4	4	No	2024	Water additive which promotes strong teeth
UNREGULATED CONTAMINANTS							
Sodium, ppm	46.7	38.2 – 46.7	NA (a)	NA (a)	No	2024	Erosion of naturally occurring deposits; road salt

Water Quality Data Footnotes:

- (a) **Sodium:** There is no state or federal MCL for sodium. Monitoring is required to provide information to consumers and health officials that are concerned about sodium intake due to dietary precautions. People on a sodium-restricted diet should consult their physician about the level of sodium in the water they drink.

Unregulated contaminant monitoring (UCMR5)

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to assist the EPA in determining the occurrence of unregulated contaminants in drinking water and whether future regulation is necessary. Every five years, the EPA issues a new list of no more than 30 unregulated contaminants to be monitored. The table below provides information on the unregulated contaminants that were detected in the water system under the current round of monitoring. There were some unregulated contaminants that were not found in samples collected from this drinking water system. As our customers, you have a right to know that this data is available. If you would like more information, please contact Markesha Davis, Water Quality Sr Supervisor at 217-377-4764.

Unregulated Contaminants Detected During 2025			
Unregulated Contaminants	Average Detection	Range of Levels	Major Sources in Drinking Water
Lithium, ppb	9.2	ND – 14.1	Naturally occurring with multiple commercial users.

Water Quality Table Definitions:

Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements.

Date of Sample: Some contaminants are monitored less frequently than once a year. If any of these contaminants were detected the last time they were monitored, they are included in the table with the sample date.

Fluoride: Fluoride may help prevent tooth decay if administered properly to children but can be harmful in excess. Customers in the Philo water supply receive fluoridated water. For more information about fluoride in your tap water, call Aqua Illinois at 815.614.2032. This information may be helpful to you, your pediatrician, or your dentist in determining whether fluoride supplements or treatment are appropriate.

Level Found: For contaminants with annual or less frequent monitoring, this is the single level detected in the most recent monitoring period. For other contaminants, the level found is the annual average of multiple test results. If multiple locations were tested, the level found is the annual average for the location with the highest level. For Lead and Copper, see below.

Lead and Copper Level Found: Only the 90th percentile detection level from the most recent monitoring period of all approved sites sampled for each of these contaminants. The number of sites monitored and the frequency of monitoring is determined by the IEPA for every supply.

Locational Running Annual Average (LRAA): The average of sample analytical results for samples taken at a particular monitoring location during the previous four calendar quarters under the Stage 2 Disinfectants and Disinfection Byproducts Rule.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Nitrate: Nitrate in drinking water at levels above 10 ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant, you should ask advice from your health care provider.

ng/L: nanograms per liter or ppt – or one ounce in 7,500,000,000 gallons of water.

pCi/L, picocuries/Liter: A unit of concentration for radioactive contaminants.

ppb: Parts per billion or micrograms per liter – or one ounce in 7,350,000 gallons of water.

ppm: Parts per million or milligrams per liter – or one ounce in 7,350 gallons of water.

PWSID: Public water supply identification number

Range of Detected Levels: The range of values from all tests during the CCR reporting year. For contaminants tested annually or less frequently, only one value is reported. For Lead and Copper, see above.

NA: Not applicable.

ND: Not detected.

Running Annual Average (RAA): The average of all monthly or quarterly samples for the last year at all sample locations. Because this is a running annual average, results from the previous year may be reflected in the Level Found column while the Range of Detected Levels only reflects results from the CCR reporting year.

Our water systems are designed and operated to deliver water to our customers' plumbing systems that complies with state and federal drinking water standards. This water is disinfected using chlorine, but it is not necessarily sterile. Customers' plumbing, including treatment devices, might remove, introduce or increase contaminants in tap

water. All customers, and in particular operators of facilities like hotels and institutions serving susceptible populations (like hospitals and nursing homes), should properly operate and maintain the plumbing systems in these facilities. You can obtain additional information from the EPA's Safe Drinking Water Hotline at 800.426.4791.
